

TCC Group Holdings

Water Management Commitment

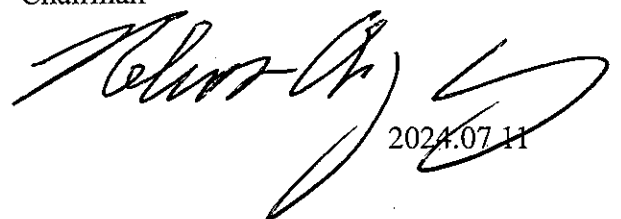

TCC upholds the philosophy of coexistence and mutual prosperity between the corporation and ecosystem, aiming for sustainable development. We recognize access to water, sanitation, and hygiene (WASH) as fundamental human rights. To pursue the sustainable utilization of water resources, we aim for "Every drop counts" by refining water resource management and enhancing water use efficiency.

TCC is committed to actively promoting initiatives to reduce water risks, especially in water-risk areas. We focus on minimizing the potential impact of water withdrawal and discharge on ecosystem and communities where we operate.

Realizing sustainable water resource utilization is an integral part of TCC's sustainable business philosophy, TCC is committed to:

- We assess the level of water stress, along with related risks and opportunities, at each operational site. We develop effective water resource management procedures and plans, and implement water flow and quality tracking management, to mitigate and adapt to water resource-related risks.
- We identify opportunities for water efficiency improvements and adopt measures such as application of water recycling/reuse, reducing water consumption and leakage, and developing diverse water resources, to decrease water withdrawal. Additionally, we establish targets and goals to reduce water use.
- We regularly test and monitor discharge water, continually improving discharge water and wastewater quality to control and reduce the emission of hazardous substances.
- We will provide employees and suppliers with awareness training and capacity building regarding water conservation, and encourage them to demonstrate responsible behavior towards the sustainability of water resources.
- We will communicate and establish collaborative relationships with local governments, institutions, communities, and other stakeholders to address the challenge of water resource conservation together.
- We ensure compliance with all applicable local, regional, national, and international regulations related to water resources. Depending on the conditions of our operational sites, we take environmental actions that exceed legal standards.
